

5710 FLAIL FORAGE HARVESTER

Whether you're chopping green forage for cattle feed or shredding crop residues after harvest, you'll find that the **Hiniker 5710 Flail Forage Harvester** offers outstanding versatility from a simple, reliable design. By using the 32-knife flail cylinder as both cutter and impeller, the expense and maintenance of a separate conveyor and blower system is eliminated. The adjustable discharge spout assures even front-to-rear loading. Or you can open the rear discharge door to bypass the spout and spread

material evenly on the ground. Cutting height ranges from 2-10 inches (5-25cm) and can be controlled with a manual ratchet jack or by a hydraulic cylinder. An adjustable shearbar changes the length of cut of the harvested material. To keep things running smoothly, all 5710's come with constant-velocity P.T.O. drive shafts and overrunning driveline clutches, reducing wear and tear on driveline components during turns or when shutting down the P.T.O. A slip clutch provides overload protection.

Adjustable discharge spout is controlled from the tractor seat for easy, even loading.

A constant-velocity P.T.O. shaft protects the driveline during turns, reducing wear on drive components.

32 high-vacuum knives provide cutting and blowing action, eliminating separate conveyors and blowers.
